

### April 2014:

The 2014 growing season commenced slowly. Daytime highs averaged slightly above normal while overnight lows averaged below normal. Accordingly, accumulated growing degree days (base 10°C) accumulated slowly and were below normal for the month. The growing-degree-day accumulation at the end of April 2014 was below that of April 2012 but similar to 2013. April rainfall averaged 89% of normal across the appellation. Rainfall across the month was well below normal until the last two days of April brought approximately 25-35mm to the region.
